

BFK pan conveyor HEKO chain wheels

HEKO sets the standard for the sprockets from apron conveyors. Toothed drive wheels and reversing wheels with interchangeable segments and protective pitch. The protective pitch effects the contact of teeth in every other sprocket rotation and leads to a significant increase in lifespan

The contact surfaces of the toothed sprockets are hardened inductively. The realized surface hardness and depth of hardness are on the operational demands. Also, the surface hardness and hardness depth of the bushings adapted to the respective bush conveyor chain ensures the longest possible lifespan of chain and sprocket.

In addition to the standard sprockets, HEKO also manufactures special drive and deflection wheels for steel cell conveyors, which in terms of dimensions and geometries can be adjusted to the respective conveying task. In addition to the sprockets, and in its own production facilities, HEKO also manufactures complete drive and deflection units consisting of sprockets, shafts / axes and bearings according to your requirements and specifications. Gladly advise we help you to optimize your funding task
